Day 10 Assignment

Code review round 1 + integration checkpoint

Week 2 - Implementation

Day goal

- Review all modules working together on main, verify the integrated workflows, and fix the first real bugs.

Per-member assignments and expected outputs

Member 1 - Team Lead; backend app/main.py and integration

- Assignment: Pull or confirm the latest main, install requirements, start the API, and run the full test suite. Check /health, prompt miss then hit, /api/pdf/today with a real PDF, and /api/grid/stats in Swagger. Add POST /api/grid/clear and its regression test; fix review bugs, collect member status notes, and write the Week 2 midpoint note and Days 11-12 bug list.
- Expected output: Review round 1 completed; health, prompt miss/hit, PDF upload, grid stats, and clear endpoint verified; midpoint status note and Days 11-12 bug list recorded.

Member 2 - Memory grid and app/services

- Assignment: Add GridRouter tests proving the same key always selects the same node and that 100 keys distribute roughly evenly across nodes.
- Expected output: GridRouter stability and approximate spread tests pass.

Member 3 - PDF processing

- Assignment: Handle multi-page PDFs and files with 10 or more pages; confirm extraction returns all matches without crashing and record extraction timing.
- Expected output: Multi-page and large-PDF extraction succeeds; all matches are returned and timing is noted.

Member 4 - worker/ and tests/

- Assignment: Add an integration test for POST /api/prompt through the worker, including request_id roundtrip, in tests/test_api_worker.py.
- Expected output: Worker/API integration test verifies request_id roundtrip.

Member 5 - frontend/

- Assignment: Complete the PDF upload UI roundtrip: file picker, POST /api/pdf/today, and display of the matches list.
- Expected output: Browser upload roundtrip displays the returned PDF matches.

Commands and verification

- pip install -r requirements.txt
- uvicorn app.main:app --reload
- pytest tests/ -v
- Open http://localhost:8000/docs and verify /health, /api/prompt (miss then hit), /api/pdf/today with a real PDF, and /api/grid/stats.
- curl -X POST http://localhost:8000/api/grid/clear

- curl -X POST http://localhost:8000/api/pdf/today -F "file=@sample.pdf"

GitHub push and review

- Create your branch: git checkout -b member<N>-day10
- Stage your changes: git add .
- Commit: git commit -m "day10: <what you did>"
- Push: git push origin member<N>-day10
- Open a PR; Member 1 reviews and merges after checks pass.
- After all PRs are merged: git checkout main && git pull; git tag day10 && git push origin day10

End-of-day checklist

- [ ] Full roundtrip works: UI to prompt to cache hit; UI to PDF to matches.
- [ ] /api/grid/clear is added and its test passes.
- [ ] All tests pass (pytest plus any frontend checks).
- [ ] Days 11-12 bug list is created.
- [ ] All PRs are merged, the day10 tag is pushed, and member status notes are collected.
