Day 05 Assignment

Day 5 assignment - skeletons and first runnable UI

Foundations (Days 1-7)

Day goal

- All module skeletons work, the backend /health endpoint is live, and React renders.

Per-member assignments and expected outputs

Member 1 - Team Lead; backend app/main.py and integration

- Assignment: Finish app/main.py with the FastAPI app; make GET /health return {"status":"ok"}. Add POST /api/prompt and POST /api/pdf/today route stubs, calling Members 2 and 3 modules when ready (a 501 placeholder is acceptable meanwhile). Run `pip install -r requirements.txt`, `uvicorn app.main:app --reload`, and `curl http://localhost:8000/health`. Collect status from Members 2-5 (done/blocked), review and merge their PRs, resolve conflicts, keep main green, and tag day5.
- Expected output: main runs and /health returns OK; PRs from all five members are merged. Collect a 2-line status note from each Member 2-5 for the daily report.

Member 2 - Memory grid and app/services

- Assignment: Implement the MemoryNode TTL skeleton in app/services and report whether it is done or blocked.
- Expected output: MemoryNode TTL skeleton is available in app/services.

Member 3 - PDF processing

- Assignment: Implement extract_pdf_text with pypdf and report whether it is done or blocked.
- Expected output: extract_pdf_text works with pypdf or clearly reports a blocker.

Member 4 - worker/ and tests/

- Assignment: Create the process_prompt skeleton in worker/, add a basic test, and report whether it is done or blocked.
- Expected output: process_prompt skeleton and its test are present.

Member 5 - frontend/

- Assignment: Build and render the React prompt form; report whether it is done or blocked.
- Expected output: React prompt form renders in the frontend.

GitHub push and review

- Create the branch: git checkout -b member1-day5
- Stage the backend and integration test: git add app/main.py tests/test_day5_integration.py
- Commit: git commit -m "day5: FastAPI app + /health + route stubs"
- Push: git push origin member1-day5
- Open a PR; review and merge member2-day5, member3-day5, member4-day5, and member5-day5.
- Member 1 resolves conflicts, self-reviews the changes, and merges only after checks pass.
- Confirm main is green, then tag and push: git tag day5 && git push origin day5

End-of-day checklist

- [ ] All five members posted a done/blocked status for day 5.
- [ ] Each expected output is present or has an explicit blocker and owner.
- [ ] Relevant tests and local smoke checks pass.
- [ ] Changes are pushed, reviewed, and merged through PRs; main is green.
- [ ] Record the day summary and remaining follow-up work.
